

Submission Document

After you have trained and found the best model you can use it for predicting unseen data. Data has been provided in "test.csv" for testing which should not be used for training and used only after finalising the models.

Steps for submission

1. Preprocess the test data similar to the way train data was preprocessed.
2. Use your best model and and preprocessed data to get predictions for 'adview' for each video
3. Save that as "Predictions_Submission.csv"

Documents to include

1. Written document explaining steps for training. Include plots as well.
2. Create a table of all the models and their mean square error. Highlight the chosen model and give reasoning.
3. Training code as ".py" or ".ipynb" files.
